## 2 Timing Sample Dataset

A fixed sample of images randomly selected from the PFT III datasets are used to assess whether or not an implementation adheres to the minimum timing requirements set forth in the PFT III test plan. This sample is also used to provide an estimate on template size. The images and comparisons are identical to the "1K Sample Evaluation" from NIST's PFT II evaluation, with the exception of the "IARPA N2N" dataset, which is new in PFT III. Table 2 shows information about the maximum dimensions and resolutions of the images in each of the timing sample datasets.

Table 2: Maximum dimensions in pixels and capture resolution in pixels per inch (PPI) for the images in each of the subsets comprising the timing sample dataset.

### 2.1 Template Size

Figure 1 and Table 3 show the distribution of file sizes of templates. Failures of any kind reported during template generation result in NIST code writing 0 byte files. These files are excluded from the template size analysis in this section.

### 2.2 Template Creation Time

Figure 2 and Table 4 show the distribution of durations of time consumed when creating templates. Failures of all kinds are incorporated into these statistics, since this time would be observed by the end user of a template creation algorithm.

Times are measured by running a single process on an isolated compute node equipped with an Intel Xeon Gold 6254 CPU.

### 3 PFT III Datasets

Although large tests, both PFT and PFT II only used *subsets* of data available from the Arizona Department of Public Safety, the Los Angeles County Sheriff's Department, and the Department of Homeland Security. For PFT III, NIST is using new subject comparisons from each of these datasets. Additionally, PFT III adds comparisons of public and sequestered data collected as part of the Intelligence Advanced Research Project Activity (IARPA)'s Nail-to-Nail (N2N) Challenge.

### 3.1 Arizona Department of Public Safety

The Arizona Department of Public Safety (AZDPS) dataset consists of plain and rolled impressions of all ten fingers. Figure 4 and Table 6 show the detection error tradeoff (DET) curves of all fingers not compared in other PFT tests. This data is separated by finger position in Figure 5 and Table 7 and again by impression type in Figure 6 and Table 8. Values made by combinations of fingers were generated by summing the individual similarity scores for comparisons of the individual finger and dividing by the number of values added. This technique is known as *sum fusion*.

## 3.2 Los Angeles County Sheriff's Department

The Los Angeles County Sheriff's Department (LASD) dataset consists of plain and rolled impressions of all ten fingers, captured with a mixture of ink and optical devices. Figure 7 and Table 9 show the DET of all fingers not compared in other PFT subsets. This data is separated by finger position in Figure 8 and Table 10 and again by impression type in Figure 9 and Table 11. Curves made by combinations of fingers were generated by sum fusion.

#### 3.5 IARPA Nail-to-Nail

In September 2017, IARPA held a fingerprint data collection as part of the *Nail to Nail Fingerprint Challenge*. Participating Challengers deployed devices to capture a rolled-equivalent print. Approximately two-thirds of the ten-print data collected was released to the public as NIST Special Database 302, with the rest being sequestered at NIST for evaluations like PFT III.

Information about the Challenge can be found in NIST IR 8210. Descriptions of the devices described by the device codes in the following figures and tables can be found in NIST TN 2007.

#### 3.5.1 By Device

The following figures and tables show the DET of all comparisons from select devices in the IARPA N2N Challenge. All probe devices imaged natively at 500 PPI, except for **J**, **R**, and **U**, which imaged at 1000 PPI. The reference device, **V**, also imaged natively at 1000 PPI. When these higher resolution devices are shown at 500 PPI, they were downsampled using *NIST Fingerprint Image Resampler (NFIR)*.

Figure 14 and Table 16 show results with 500 PPI probes against 1 000 PPI references. Figure 15 and Table 17 show the same probe images against reference images downsampled to the same resolution. Figure 16 and Table 18 show native 1 000 PPI to 1 000 PPI comparisons for supported devices.

#### 3.5.2 Resample Test

PFT III supports encoding of variable resolution images. It is thought that several fingerprint feature extractors downsample imagery to a lower resolution before extracting features. To test this theory, we downsample and compare source and reference imagery both captured natively at 1 000 PPI. All downsampling was performed using *NFIR*.

Images were compared at all combinations of 100, 250, 300, 333, 500, 600, and 1000 (native) PPI.

Figure 17 and Table 19 show match rates against 1000 PPI references. Figure 18 and Table 20 show match rates against 600 PPI downsampled references. Figure 19 and Table 21 show match rates against 500 PPI downsampled references. Figure 20 and Table 22 show match rates against 333 PPI downsampled references. Figure 21 and Table 23 show match rates against 300 PPI downsampled references. Figure 22 and Table 24 show match rates against 250 PPI downsampled references. Figure 23 and Table 25 show match rates against 100 PPI downsampled references.

## 6 Comparison to MINEX III

Minutia Exchange (MINEX) III is NIST's ongoing test of interoperable fingerprint template generation and matching. The only data permitted to be stored in a MINEX-compliant template are minutia type (ridge ending, bifurcation, or unknown), angle, location, and quality, as well as finger position and image quality. PFT III templates have no restrictions on the contents of the template. The results shown in this section are computed based on the exact MINEX III dataset, but using the proprietary template generator and matcher from innovatrics+0003.

Note that while *Innovatrics* may be a participant in both PFT III and MINEX III (perhaps even with the same identifier of innovatrics+0003), it **does not** indicate that the same underlying implementation was used. Information about equivalence of implementations should be addressed to the participant.

## 6.1 Single Finger

Figure Figure 28 and Table 30 show single finger results, which corresponds to Figure 2 and Table 4 from any MINEX III report card.

## 6.2 Two Finger

Figure 29 and Table 31 show combined two finger results (i.e., sum fusion of the single finger results), which correspond to Figure 7 and Table 7 from any MINEX III report card.
